- Shift Supervisors
- Management Team
- End Customer

Reporting

- No setup on phone
- Review critical summary status of system on the go
- View Trend line performance
- Alarm escalation with text messaging
- Push service information out to customers as value-added service

The new iCompass service provides status of critical assets of the network through a hosted mobile application, providing both the business unit, operations & engineering with the ability to always have status within reach even while on the go. Combining with existing features of Compass provides a powerful management system with autonomous logic to minimize down time, provide remote access for expert personnel to guide onsite personal, business reporting to management and end customer value added access so they can feel secure having status to their services on the go.

Everything is configured on the Compass server and pushed out to the iCompass service account holder, so Mobile users having nothing to configure other than downloading and launching the application. The information available to the mobile account is autonomously passed to the mobile application with data refreshing every 10-20 seconds. All user accounts, security and data settings are administered from the server so only the data desired to be sent will be forwarded to the accounts, allowing the sensitive data to be restricted except to those who need access.
